With still more surgery to contend with (eyes this time). I thought I would give David Vizard a call to see how he was holding up. I sort of expected to talk to someone who was at least a little down but no, the reverse was actually the case.

I remember reading through a magazine, not sure which one it was, but it said it was possible to run 12.5:1 Compression on pump gas. It gave information about Cylinder head combustion chamber shape, it explained about what quench is, the total cc's above the piston at TDC etc. I lost the Article but if anyone has information on this that would be really helpfull Thanks.
